AB - JP11140160 NOVELTY - A radiation-curing compound (A) is prepared by reacting (a) epoxy compound having 2-20 epoxy groups in a molecule with (b) ethylene unsaturated monocarboxylic acid and/or ethylene unsaturated alcohol.

- INDEPENDENT CLAIMS are given for:

- (i) a radiation-curing oligomer (A') which is prepared by reacting (a') internal epoxy compound having 3-20 epoxy groups in a molecule with (b) and then by polycondensing the reaction products with (c) polyvalent carboxylic acid and/or polyhydric alcohol; and

- (ii) a radiation-curing coating composition which comprises 5-94.5 wt. % of (A) or (A'), 5-94.5 wt. % of (B) epoxy compound which is liquid at normal temperature; and 0.5-15 wt. % of (C) a photopolymerisation initiator.

- (B) contains 20-100 wt. % of alicyclic epoxy compound.

- (a) is, e.g., bis(3,4-epoxycyclohexyl) adipate, soy bean oil epoxidised compound or epoxidised polybutadiene.

- (b) is, e.g., hydroxyalkyl(meth)acrylate, polyethyleneglycol mono(meth)acrylate, (meth)acrylic acid or beta-styrylacrylic acid.

- USE - The coating composition can be applied to metal or resin film and is preferably applied to drinking cans.

- ADVANTAGE - Compound (A), oligomer (A') and the coating composition have good curing speed and good adhesion to a base material. After curing, they have good retort resistance and mechanical processing properties.
